PREFACE

Coastal Marine Research Inc. deployed a current meter array at the Punta Tuna, Puerto Rico OTEC site in September 1979 using current meters loaned by National Oceanographic and Atmospheric Administration (NOAA)/ Atlantic Oceanic and Meteorological Laboratories (AOML). Recovery was accomplished from O.S.S. Researcher in March 1980 by NOAA/AOML and Lawrence Berkeley Laboratory personnel. Additional field data was obtained by EG&G during a deployment cruise in June 1980 (PROTEC-08)

Data processing and primary report preparation was done by EG&G. The report presented here has been edited by LBL from the draft report.

EXECUTIVE SUMMARY

Current meter data taken at three depths at the Punta Tuna, Puerto Rico OTEC site ($17^{\circ}53'49''N$, $65^{\circ}45'14.5''W$) from 27 September 1979 to 8 February 1980 are summarized below:

Depth meters	Maximum Speed cm/sec	Mean Speed cm/sec	Standard Deviation cm/sec	Dominant Direction Degrees True	% of Observations in that Direction
125	36.0	13.4	6.0	225° - 270°	63.3
239	39.5	15.5	7.3	225° - 270°	63.3
932	21.4	6.4	3.9	240° - 285°	24.2

18 XBT and 15 CTD stations taken in June 1890 from the R.V. Jean A of the Puerto Rican Department Natural Resources indicated the following oceanographic conditions, which are in accord with archival records. Tropical surface water (28.5°C , 35.8 ‰) extended in a mixed layer to 50 meters. A ΔT of 20°C from the surface was found at 700 meters, approximately. The subtropical underwater salinity maximum was found at 150 meters. At 1000 meters temperatures were constant at 5.5°C .

1. INTRODUCTION

This report is the first in a series of data reports describing the results of an oceanographic measurement program being conducted off the southeast corner of Puerto Rico. EG&G, Environmental Consultants is performing the work for Lawrence Berkeley Laboratories (LBL) in support of the Department of Energy's Ocean Thermal Energy Conversion (OTEC) program. The study site is a proposed OTEC site and is located about 20 km off Punta Tuna.

The objectives of the measurement program are to document the physical oceanography of the site as related to the engineering and environmental factors involved in OTEC design and operation. Oceanographic measurements include:

- 1) A subsurface mooring instrumented with five current, temperature, and pressure recorders.
- 2) Quarterly hydrographic cruises to measure salinity, temperature, and depth profiles on a grid of 33 stations in the vicinity of the mooring site.

The first cruise, conducted between 16 and 21 June 1980, included the initial mooring deployment and a CTD (conductivity, temperature, and depth) and XBT (expendable bathythermograph) survey. The CTD/XBT measurements are presented in this report and results of the in situ measurements will be included in subsequent reports.

Also included in this report are results of in situ current, temperature, and pressure measurements made during two previous programs. In September 1979, Coastal Marine Research (CMR) deployed a mooring at approximately the same site as the present mooring. Results from three of these instruments

are included in Section 3 of this report. The Naval Underwater Systems Center deployed a mooring at this site in February 1979 and partial results from one instrument on this mooring are also presented in Section 3.

The second oceanographic cruise on the present program is planned for August 1980 and will include a mooring retrieval and redeployment and an XBT survey. A data report describing these data will be issued in October 1980.

2. DESCRIPTION OF THE MEASUREMENT PROGRAM

2.1 MEASUREMENTS PERFORMED DURING THE JUNE 1980 CRUISE

A Neil Brown Instrument Systems, Inc., Mark III CTD system with associated XYY recorder and audio tape recorder was used to obtain profiles of temperature and conductivity at the stations shown in Figure 2-1. Water samples were collected and reversing thermometers were tripped (at the bottom of most casts) to provide a check on CTD operation. A total of 15 CTD stations were occupied and good quality data were recorded at each station.

XBT profiles were collected using a Sippican Model MK2A recorder with T-7 probes, providing temperature profiles to a depth of about 900 meters. Nineteen XBT casts were made and good quality data were recorded on each cast. Sea surface temperature was measured with a mercury thermometer at each XBT station as a check on XBT operation.

The CTD and XBT operations were conducted over a 5-day period between 17 and 21 June 1980. Prior to the CTD work, a brief bathymetry survey in the area of the planned mooring location was conducted. On 21 June 1980, a mooring instrumented with five current meters was deployed at $17^{\circ}54'N$ latitude and $65^{\circ}45'W$ longitude in about 2020 meters of water (Figure 2-2).

Instrumentation on the mooring consisted of two Neil Brown Acoustic Current Meters (NB-ACM) and three Aanderaa RCM-5 Current Meters. The NB-ACM's, which measure current by using the phase shift in a sound wave propagating between closely spaced transducers, were installed at depths of 120 and 160 meters. The RCM-5's, which utilize a Savonius rotor and vane assembly to measure current velocity, were installed at depths of about 235, 435, and 935 meters. Note that these depths are about 85 meters deeper than originally planned because the precise water depth at the mooring site was not positively known prior to deployment.

The current meters were programmed to record data for a minimum of 90 days. The NB-ACM's measure average current velocity during every 2-minute interval and record 10 of these averages and a single temperature value every 20 minutes. The RCM-5's, equipped with extended data storage capability, record average current speed, instantaneous current direction, temperature, and pressure at 10-minute intervals.

The mooring was deployed using an anchor-last method and was located using a Motorola Mini-Ranger with shore-based transponders installed at Punta Tuna and Punta Lima. The anchor was released at 1255 (local time) on 21 June 1980.

2.2 CURRENT DATA COLLECTED DURING PREVIOUS PROGRAMS

Current data from two outside sources are included in this report. A single RCM-5 record was recovered from a mooring deployed by the Naval Underwater Systems Center in February 1979. The recovered instrument was deployed at about 100-meter depth at $17^{\circ}51'42"N$ latitude and $65^{\circ}49'54"W$ longitude and was programmed to record current velocity, temperature, and pressure at 10-minute intervals. Approximately 31 days of data were collected before the instrument either malfunctioned or sank to a depth below its pressure sensor range. The speed data recorded by this instrument included numerous erroneous high speed values which limit the usefulness of these data.

Data from another mooring deployed at $17^{\circ}53'49"N$ latitude and $65^{\circ}45'14.5"W$ longitude are also included in Section 3. On this mooring (Figure 2-3), four Aanderaa RCM-5's were positioned at depths of 125, 180, 239, and 932 meters in about 2015 meters of water (Coastal Marine Research, 1980). Three of these instruments functioned normally for 2 to 3 months while the fourth (180-meter depth) failed to record any data. These instruments were deployed on 27 September 1979 by Coastal Marine Research and retrieved by NOAA in March 1980. The RCM-5's recorded data on current, temperature, and pressure at 20-minute intervals.

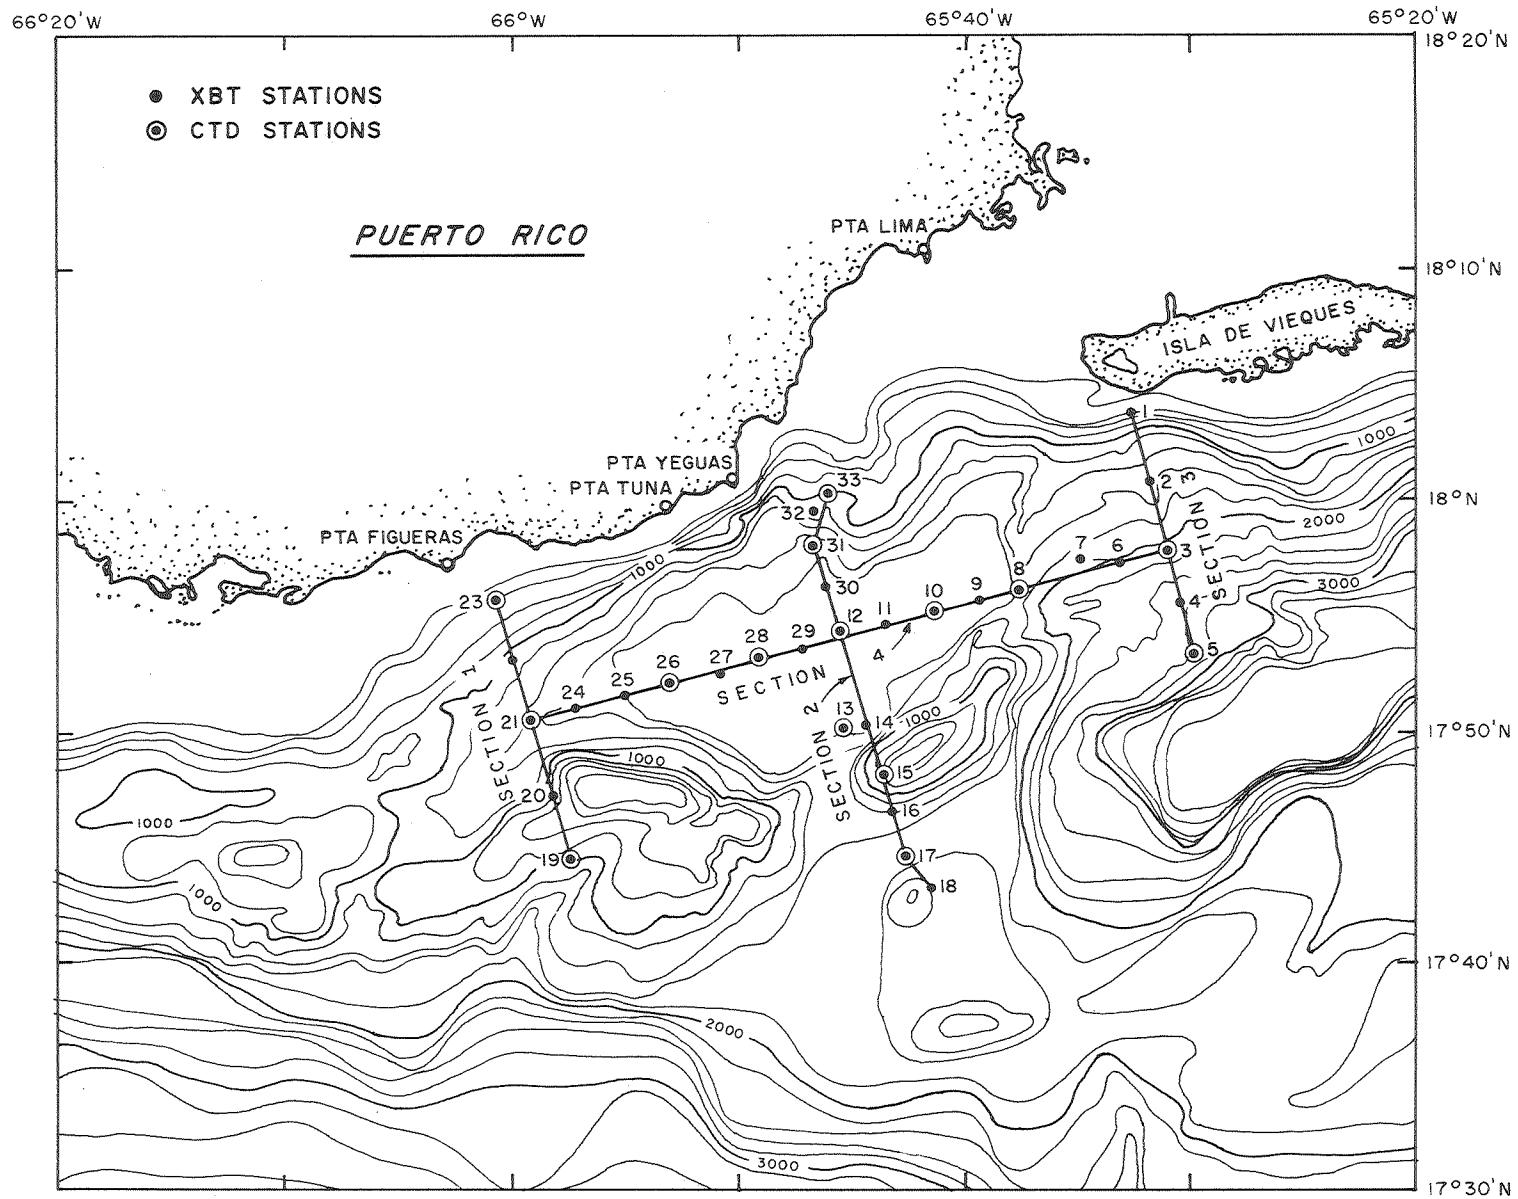

Figure 2-1. Locations of the mooring site and the XBT and CTD stations.
Mooring is located at approximate position of Station 12.

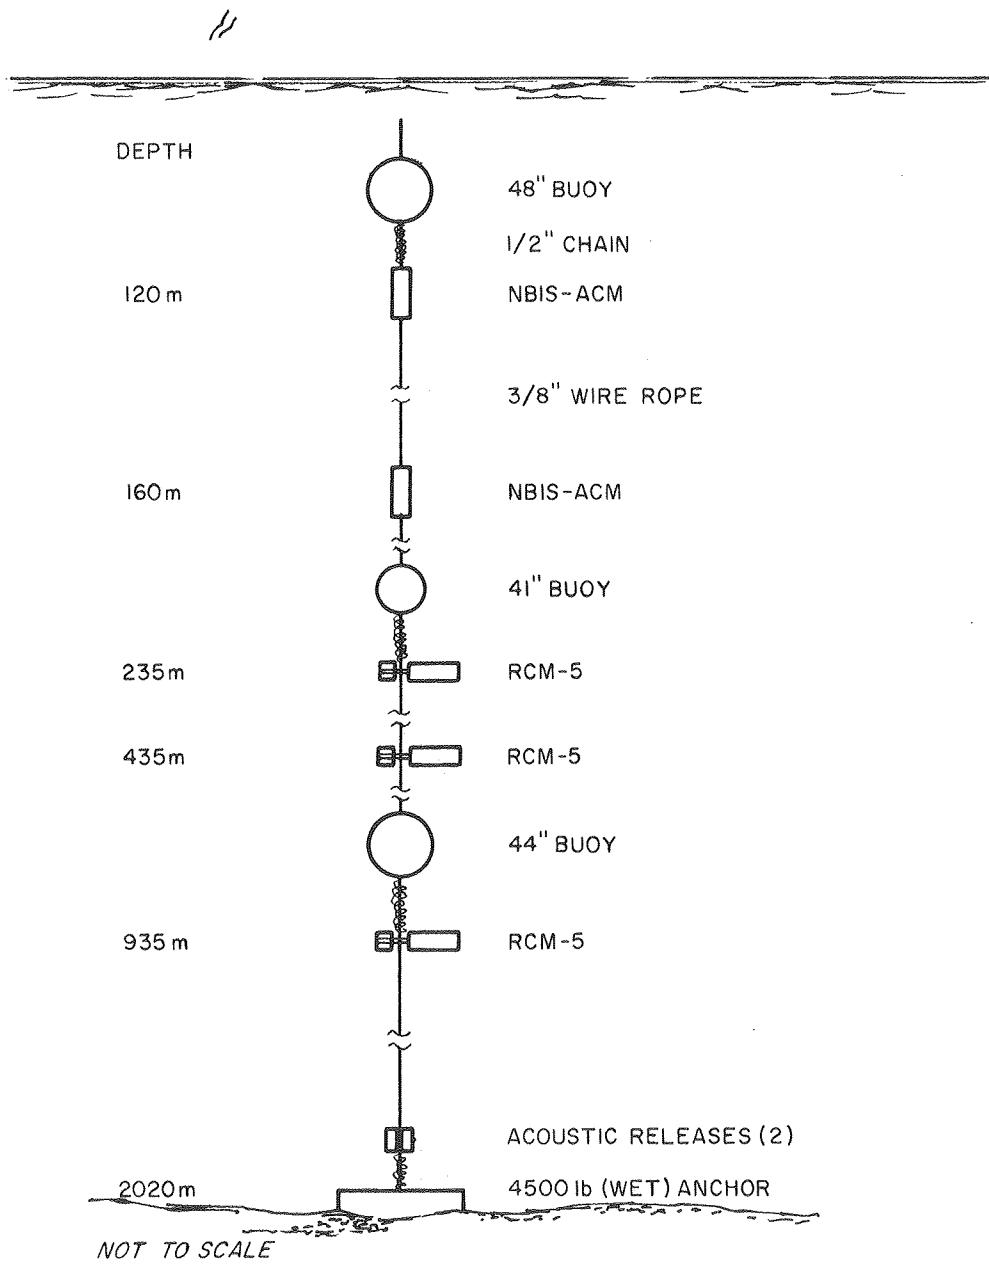

Figure 2-2. Mooring deployed at $17^{\circ}54'N$ and $65^{\circ}45'W$ on 21 June 1980.

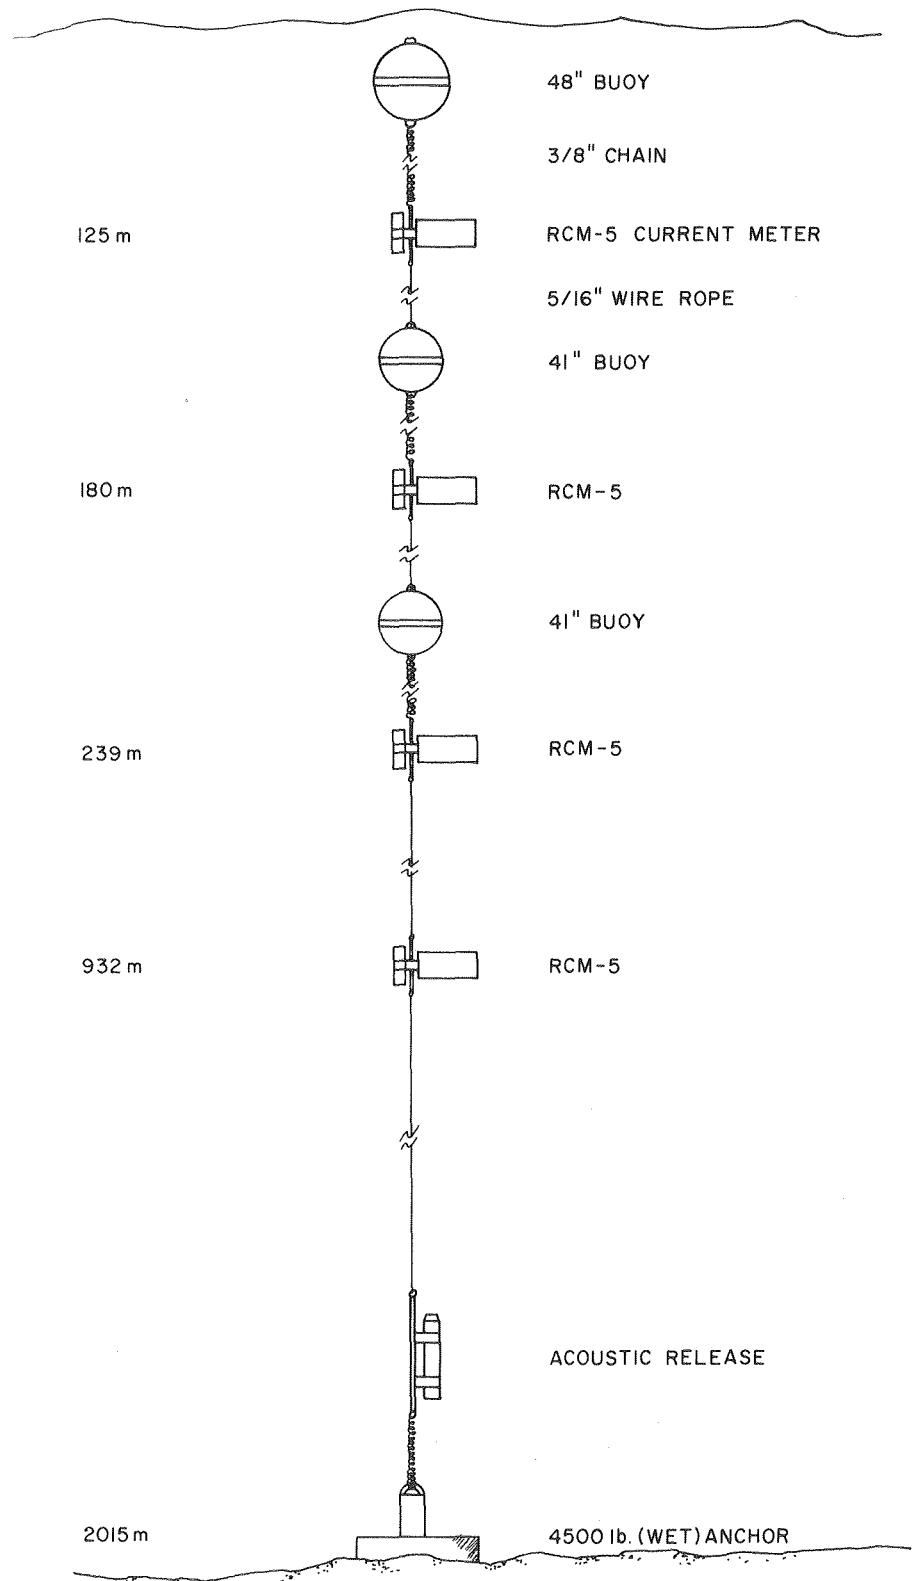

Figure 2-3. Mooring deployed by CMR at $17^{\circ}53'49''N$ and $65^{\circ}45'14.5''W$ on 27 September 1979.

3. DESCRIPTION OF THE DATA PRODUCTS

3.1 CTD AND XBT DATA PRODUCTS

CTD data recorded on the audio tape recorder were transcribed onto a 9-track digital tape at EG&G's Waltham facility. This 9-track tape was then used to produce an edited tape from which salinity and depth were calculated from the measured parameters using programs developed at Woods Hole Oceanographic Institution (Scarlet, 1975). Values of salinity, temperature, and depth at 0.5-meter intervals were checked for quality and then archived.

XBT traces were digitized and transcribed to 9-track tape at WHOI. The digitized data were then checked for quality against the original records and archived on EG&G's data archive system. The archived data from the CTD and XBT were used to produce the displays described below.

3.1.1 Temperature Profiles (XBT Data)

Figures 3-1 through 3-19 show temperature in °C versus depth in meters. Station number is shown at the top of each plot and should be referenced to Figure 2-1.

3.1.2 Temperature, Salinity, σ_t Profiles (CTD Data)

Figures 3-20 through 3-34 show temperature (°C), salinity (‰), and σ_t versus depth as computed from CTD casts at the stations shown in Figure 2-1. σ_t is defined as (ρ_{st} -1) × 1000 where ρ_{st} equals the density of seawater at the observed salinity, s, temperature, t, and at atmospheric pressure.

3.1.3 Sea Tables

Tables 3-1 through 3-14 show the measured temperature, conductivity, and pressure as well as a variety of computed variables at 25-decibar pressure intervals (Note that Station 12 is not included in these tables due to noise in this data record.) Starting from the left side of this table, the variables listed are:

<u>Column</u>	<u>Variable</u>
1	Pressure (dbars)
2	Depth (meters)
3	Temperature ($^{\circ}$ C)
4	Conductivity (mmhos/cm)
5	Salinity (parts per thousand)
6	σ_t
7	Specific volume (inverse of density - cm^3/gm)
8	Specific volume anomaly (cm^3/gm) - the difference between the specific volume of this water and standard seawater ($35 \text{ }^{\circ}/\text{oo}$, 0°C , in situ pressure)
9	Travel time of sound (seconds)
10	Dynamic height (dynamic m). Integral of the specific volume anomaly over the depth range.
11	Brunt-Vaisala frequency (cycles/hour)
12	Sound velocity (meters/sec)

3.1.4 Temperature Sections

Temperature sections (Figures 3-35 through 3-38) are based on CTD and XBT data plotted along each of the 4 lines shown in Figure 2-1. Isotherms in $^{\circ}\text{C}$ are plotted every 2°C .

3.1.5 Salinity Sections

Salinity sections (Figures 3-39 through 3-42) are based on CTD data and are plotted along each of the 4 lines shown in Figure 2-1. Isohalines are plotted every $0.2 \text{ }^{\circ}/\text{oo}$.

3.2 CURRENT METER RESULTS

Aanderaa tapes from both the CMR and NUSC deployments were transcribed onto 9-track tape at EG&G's Waltham facility. After checking these data for quality, current speed, direction, temperature, and pressure values were archived and a 9-track tape of the unaveraged values was produced. Note that the NUSC data record was judged to contain poor quality speed data. As a result, not all data products were produced for this record. From the archived data, a series of data products has been produced which are presented in this section. These products include:

3.2.1 Time Series Displays

Half-hour averages of 9 variables from each current record are plotted as a function of time in Figures 3-45 to 3-47. Starting from the top, the following variables are plotted:

1. Current speed (cm/sec)
2. Current direction (true)
3. Current vector (cm/sec). A line drawn up from the origin represents a current flowing to the north.
4. North component of current velocity (cm/sec)
5. East component of current velocity (cm/sec)
6. Cross-isobath component of current velocity (cm/sec)
7. Along-isobath component of current velocity (cm/sec)
8. Temperature ($^{\circ}$ C)
9. Pressure (mbars)

In addition to the current time series, a plot of wind velocity versus time is presented in Figure 3-48. The time interval in this plot is coincident with the deployment period of the CMR current meters. The following wind variables are plotted at hourly intervals:

1. Wind speed (m/sec)
2. Wind direction (true)
3. Wind vector (m/sec). A line drawn up from the origin represents a wind from the north.

3.2.2 Current Statistics

Tables 3-15 through 3-18 summarize the current information according to frequency of occurrence within speed and direction intervals. In addition, sums and percentages of total occurrences are given for each speed class and direction class, along with other statistics such as mean, extreme speeds, mean component speeds, and standard deviations. Note that the data from the NUSC current meter, Table 3-18, is contaminated by erroneous high speeds.

3.2.3 Current Histograms

In Figures 3-49 through 3-72, percent of time of occurrence is shown on the ordinate and the measured value is shown on the abscissa. The following variables are plotted in this manner:

1. Current speed (cm/sec)
2. Current direction (true)
3. North component of current vector (cm/sec)
4. East component of current vector (cm/sec)
5. Along-shore component of current vector (cm/sec)
6. Cross-shore component of current vector (cm/sec)
7. Pressure (mbars)
8. Temperature ($^{\circ}$ C)

3.2.4 Polar Histograms

Polar histograms of current velocity are shown in several formats as described below and shown in Figures 3-73 through 3-84.

1. Current rose showing the frequency of occurrence of currents in 22.5° direction sectors with the percent of speed values within each sector indicated by the plotted symbol.
2. Percent time plot showing the frequency of occurrence of currents within 5° direction sectors.
3. Total displacement plot showing the total displacement (speed times sampling interval) of a water parcel apparently resulting from currents within each 5° direction sector.
4. Per mil occurrence plot showing the frequency of occurrence of currents within each 5 cm/sec and 10° speed/direction bin.

3.2.5 Kinetic Energy Spectra

Energy density is plotted on the ordinate and frequency in cycles per hour is plotted on the abscissa in Figures 3-85 through 3-99. The spectra have been computed from fast Fourier transforms of the data using a cosine taper with 50% end-lap. Hourly averaged data were used in this computation and five frequency bands were averaged to obtain each spectral estimate.

Depending on record length, three 15-day segments (NUSC) or five 30-day segments (CMR) with about 50% overlap were used to compute individual spectra which were then averaged to produce the figures presented. Note that the spectra obtained for the NUSC current record is contaminated by noisy data. Ninety percent confidence limits are plotted on each spectrum.

The following spectra are shown for each current record:

1. Total energy, i.e., the sum of the clockwise and anti-clockwise spectra
2. Clockwise component of current velocity
3. Anticlockwise component of current velocity
4. North component of current velocity
5. East component of current velocity
6. Along-isobath component of current velocity
7. Cross-isobath component of current velocity

4. DISCUSSION

4.1 HYDROGRAPHIC MEASUREMENTS

The general nature of the hydrography of the waters off Punta Tuna in June is illustrated by the figures shown in Section 3. A well-mixed layer with uniform temperature, salinity, and density is present between the surface and about 50 m depth. A very sharp pycnocline occurs between about 50 and 150 m, below which density increases much more slowly. Temperature at the surface is about 28°C. Below 50 m, temperature decreases approximately linearly with depth to about 700 m. At 1000 m depth, water temperature is about 5.5°C.

The salinity profile is characterized by surface values of about 35.8 ppt, a subsurface maximum (37 ppt) at about 150 m, and a mid-water minimum of about 34.85 ppt at 850 to 900 m depth. The T/S relationships observed at each CTD station were quite similar. A small amount of variability in the region of the salinity maximum was observed at several stations.

Results shown in Section 3 regarding the calculation of geostrophic currents suggest that the CTD/XBT measurement grid in use on the program is not optimal for this purpose. Specifically, station spacing is too close to obtain reliable estimates of geostrophic currents. The presence of internal tides contaminates the density measurements while the proximity of the shore and topographic extremes makes the geostrophic assumption less reliable. An attempt was made to minimize the noise in the geostrophic current computations by determining the trend in the dynamic topography across each section. These trend lines were then used to compute the mean current field across the entire section rather than between adjacent pairs of stations. The results of this analysis produced estimates of the geostrophic current field of less than 5

cm/sec directed approximately parallel to the topography. A larger measurement grid may improve the quality of these calculations. It is recommended that this aspect of the measurement program be redefined in order to maximize the efficiency of future cruises.

4.2 CURRENT MEASUREMENTS

Preliminary analysis of the current data collected on the CMR mooring indicates that the upper part of the water column experiences a steady along-isobath (250°) westward drift with net speeds of about 10-15 cm/sec. Net currents are lower at mid-water depths (0-5 cm/sec) with flows to the north and west for significant periods.

Rotary tidal currents at the semidiurnal frequency are present throughout the water column at speeds of 5-15 cm/sec. Considerable energy is also present at the diurnal frequency and at the inertial frequency (0.0258 cy/hr). At the upper two current meter levels, significant amounts of current energy were also present at frequencies corresponding to the first and second harmonics of the semidiurnal tide.

Maximum recorded currents were 36 cm/sec at 125 m, 40 cm/sec at 239 m, and 21 cm/sec at 932 m depth. Mean current speeds over the deployment interval at these depths were 13, 15, and 6 cm/sec, respectively.

Internal tides are present during much of the record as evidenced by temperature fluctuations at the semidiurnal frequency. By comparing these variations with the measured temperature profile, it is estimated that 10 to 20 m internal waves are present throughout at least the upper half of the water column on a frequent basis. The presence of internal tides during the CTD measurement program introduces significant variations in the measured density profiles, resulting in poor estimates of the geostrophic current field.

4.3 RECOMMENDATIONS FOR PROGRAM MODIFICATION

In light of the results presented in this report, two recommendations are made. First, a revised CTD/XBT grid is recommended which reduces the total

number of stations and increases the distance between stations and the size of the area sampled. The exact number of stations and their locations should be determined by examining the specific objectives of the hydrographic measurements and by an assessment of their costs.

The second recommendation concerns the data processing requirements relative to both the hydrographic and the current meter data. In general, an extensive set of data products are required for both these data sets, some of which are not particularly useful. A subset of the required products could be produced considerably more efficiently and with little or no loss in information. Specific deletions in the presently contracted program should be made after review of this report.

APPENDIX A
CALIBRATION AND QUALITY ASSURANCE INFORMATION

A program of laboratory calibration and operational checks on all of the equipment used during the study is being performed to ensure the quality of the data collected. The following pages show the calibration and/or operational checks performed on the CTD system, the XBT system, and the Mini-Ranger system. Results of this process are summarized below.

1. Neil Brown CTD System Accuracy

Salinity - +0.015 ppt relative to salinity samples

Temperature - 0.00 relative to reversing thermometers

Pressure - -15 m ±8 m at 1000 m relative to value computed from reversing thermometers.

2. Sippican XBT System Accuracy (Temperature) - +0.2°C ±0.2°C relative to mercury thermometer.

Note: The XBT system recorded temperatures about 0.2°C higher than temperatures as recorded by mercury thermometers and the CTD temperature sensors.

3. Motorola Mini-Ranger System Accuracy - ±12 m relative to standard.

4. Current Meter Operation

9	28.90	28.91	+0.01		
7	28.60	28.66	+0.06		
6	28.70	28.92	+0.22		
4	28.65	28.88	+0.23		
2	28.70	28.79	+0.09		
1	28.55	28.71	+0.16		

APPENDIX B
SEA TABLES GENERATED FROM XBT DATA

Sea Tables were produced from the XBT data collected at six stations preliminary to production of the geostrophic current profiles shown in Section 3. These Sea Tables are presented here for comparison with the Sea Tables generated from CTD data and shown in Section 3.

Table B-1. Computed values of salinity, pressure, σ_t , and dynamic height for XBT Station 6.
